

Requirements

Definitions:

- **DMovers** will refer as people going to the event or looking for a fun place to go.
- **Highlighting in Yellow** means Accomplished on Prototype.

1. Profile Page

- The 1st profile screen should be animated with pictures coming into the screen. And then you have all the login screens under the name profile.

2. Event Discovery and Personalization

- **Location-Based Recommendations (1st map):** Use a map to show nearby events in real-time (live and upcoming live events), with options to sort by distance, popularity (ex: this would use the emoji rating system), or time.
- **Event Filters:** Users can select their interests (examples of categories are music, sports, theater, fraternity, food festivals, neighborhood/small events, etc.) and receive event suggestions based on those preferences. Filters for events like what's free, family-friendly, over 21, outdoor, VIP-only, specific age groups, event type, location, price range, date, or even mood/popularity (ex: this will filter based on the emoji rating system).
- **Interactive Maps (2nd map):** For large venues (like concerts or festivals), include an interactive map showing stages, restrooms, food areas, and other important locations. In addition, it'll have a spot on the map where the user is so they can figure out how to get to the area they want to (this is another map).
 - Under the Advanced Features in the Profile page, the host will put a description of all these things (above) for events under the "Description" portion. This is up to the Host to decide if they want to add these details or not. In addition, it's up to the user to approve whether they want to see this map or not.
 - There will be a button to turn this map on or off for the host and for the users. Please put this underneath "push notification" and show a sample of how it looks when it's turned on. Please place this feature wherever you deem fit.
- **Local Venues (3rd map):** For places that aren't events but places nearby in the area that the user can go to, to have fun and meet people. It'll also have filters like restaurants, arcades, and others.
- **Event Reviews & Ratings:** Allow users to rate and review events after they attend and rate the event with our emoji system during the event, allowing users to see the vibe of the event before attending. [This is the emoji system]. People can rate the event anonymously after the event is over. Once the event is over, the rating will be done with

stars (0 to 5). It is encouraged to rate with their username for legitimacy. These reviews & ratings will stay on the host's channel, so whenever they host another event/bar/party, they will have to do their best to make their users happy and keep their rating high.

- After 24 hours, there will be an aggregate of all the reviews in the event details section.

What is the Emoji System: The emoji system is a live rating system. When a person arrives at the party/event, they can rank the party anonymously on a scale (0 to 5) to say how much fun the party is, along with a Twitter-style comment section. This scaling will be done with emojis. This scale and small comment section help the party's host see where they scale and how they should try and improve their party if people don't like it as much. **This is separate from the reviews that are written after the event.**

- Once the user clicks on the icon, the events that you reserved will appear
- Once you click on the event that you reserved or the event that you searched for, it'll ask a question (depending on whether or not their location is turned on):
 - 1st question if the user's location is turned off: "Are you at the event/location currently?"
 - A cheesy/corny phrase should appear if the answer is no, urging them to attend the event soon.
 - If yes, the 2nd question will be asked: "Is the event fun?"
 - It'll take you to the live event details page to rate the event
 - 1st question if the user's location is turned on: "I see you're at the event, are you having fun?"
 - If yes:
 - It'll take you to the live event details page to rate the event
- When the event is over, another question will be asked (this is for the rating/review).
 - 1st question: "Is the event over?"
 - If the answer is no, nothing happens
 - If they answer yes, then we ask for a review and a star rating out of 5, and it goes to the offline events page.

- **Photo & Video Sharing:** Let users upload photos and videos from the event, possibly creating a shared "event gallery." [Implement an event gallery somewhere that would enable everyone to see pic/videos from each event].
- **User-Hosted Events:** Allow users to create and host their own events (e.g., community gatherings, meetups, small performances). Only the host would have a follow option for dmovers, which allows dmovers to get updated on events from the host. The host provides details of the event.

2. Cross-Event Social Features

- **Event Friend Match:** Allow users to connect with people attending the same event (or types of events) and share their plans. They can form mini-groups, plan group meetups.
- **Event Chatrooms:** Include a live chat function where attendees can chat before the event, share excitement, or even get insider tips on the event (like the best parking or where to grab a bite nearby).
- **Social Media Integration:** Users can sync with their social media(ex: Instagram) to easily share events with friends or post about events they're attending.

3. Smart Ticketing Features

- **Seamless Event Check-In:** Let users check in digitally with QR codes or NFC (tap to enter) to avoid long lines.
- **Early Bird/Discount Offers:** Include in Advanced Settings discount offers.

4. Inclusive for All Audiences

- **Accessibility Features:** Include easy filters for accessible events (wheelchair accessibility, ASL interpreters, family-oriented spaces, etc.). The Host should also put in the description that these features exist or not.
- **Multi-Language Support:** For global reach, have multiple language options so users in different regions can engage with the app easily. The users should be able to have an advanced feature to change the language so it's readable to everyone. This should be done by the developers. Languages: French, Spanish, Igbo (Nigerian Language), and English

5. Real-Time Updates & Crowd-Sourced Data – Some of these will go underneath the Notification Page

- **Crowd-Sourced Info:** Allow users to update the app during live events (e.g., sharing info on traffic, lost items, long lines) to help others.
- **Customizable Alerts:** Users can set notifications for any event they're interested in, from a reminder a week in advance for ticket sales to a 10-minute warning before the event starts.
- **Last-Minute Alerts:** Real-time push notifications for last-minute deals, ticket drops, or venue changes.
- **Event Countdown Timer:** A countdown for major events to build excitement.
- **Live Updates:** Provide real-time updates for large events (e.g., festival schedules, lineup changes, delays, traffic updates, and most importantly, the mood of the event based on the emoji system).
- **NOTE:** If a user regularly attends certain events (like live comedy shows, street festivals, or yoga classes), the app could predict and suggest new events they may like. This live scaling also gets sent to the person who isn't there yet but is interested in going to the event to let them know the status of the party/event so the person who is unsure of whether they want to go or not can now decide if it's worth going to.

6. Hybrid & Virtual Event Integration

- **Live Streaming Integration:** For people who can't make it in person, allow users to stream major events (or virtual events) through the app with options to interact live via chat or Q&A – This will be done by the Host only.
- **Hybrid Event Coordination:** If an event is being held in-person and online, the app should provide a seamless experience for both types of attendees, with options for networking, chatting, and viewing sessions.

7. Monetization Ideas (2.0 Release)

- **Event Partnerships:** As an app, we should collaborate with event organizers to promote featured events or exclusive deals. [This is not a feature in the app]
- **Advertisement Space:** Allow businesses or local services to advertise events (think local restaurants, hotels, transportation companies) to provide more value to users, similar to YELP.
- **Partnered Deals:** As an app, we should collaborate with local businesses (restaurants, hotels, transportation) to offer exclusive deals for users attending events, like discounts for users attending events (e.g., "Show your ticket for 10% off").

- **Collaborate with other Hosts**

8. Gamification

- **Event Challenges/Badges:** Create challenges or achievements for attending events, like "Attend 5 concerts this month" or "Bring 3 friends to a meetup". Also, if the user leaves plenty of reviews with their username, they will get a "verified user" badge.
- **Rewards Points:** Users can earn points for activities like sharing events, purchasing tickets, or attending events, posting pictures/videos, which they can redeem for rewards.
 - Points can be redeemed for tickets, as stated earlier. However, the 1st 5 people who want to redeem their rewards with the host can do so, afterwards, anyone else with reward points must use it on other hosts.
 - Point Counting
 - Comment on something you get ½ a point; limit per person is 5
 - Photos are 1 point; limit per person is 5
 - Videos are 1.5 points; limit is 2 videos per person

Side Note: Reviews stay on the host page; however, the emoji system is live, so after the event is over, the emoji rating will disappear. Based on this write-up, different and the same features would be on both user accounts (Host and Dmovers). **The name “DMover” will be changed soon.**
